EDUCATION

GOMYCODE — Full-Stack Software Engineering Track, Lagos
Expected October 2026

University of Calabar — B.Sc. Political Science
2024

PROJECTS

BulkMail & Email Verifier
Node.js, Express, PostgreSQL (Neon), React, Vite, Render

- Built and deployed a bulk email platform to production on Render, with user authentication, a sending-address manager and a PostgreSQL database, and confirmed end-to-end delivery.
- Migrated the application's database to PostgreSQL on Neon and resolved production issues after launch.
- Built a companion email verifier in React, Vite and Express that validates and cleans contact lists before a campaign is sent.

Search Engine API (in progress)
TypeScript, Node.js, Express

- Building a full-text search engine from scratch, with no third-party search services: a custom web crawler, an inverted index and BM25 relevance ranking.
- Designing it as an API-key-authenticated REST service so that multiple applications can consume it without sharing internal code.
- Targeting business-directory and business-listing data as the index's first domain.

Social Media App (team of 3, in progress)
React, TypeScript, Redux, Express, MongoDB

- Collaborating with two GOMYCODE cohort-mates on a social media application for the program's lab phase.
- Engineering the application architecture: a React and TypeScript front end with Redux state management, and an Express API backed by MongoDB.

Developer Portfolio
HTML, CSS, JavaScript, Tailwind CSS, Three.js, GLSL, Vercel · Live site · Code

- Built and deployed a portfolio with a scroll-driven Three.js particle scene written in custom GLSL shaders, with fallbacks for reduced-motion users, devices without WebGL2 and slow hardware.
- Connected the contact form to Web3Forms, with handling for timeouts, failed requests, duplicate submissions and spam.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, HTML5, CSS3

Frontend: React, Redux, Tailwind CSS, Three.js

Backend: Node.js, Express, REST APIs

Databases: PostgreSQL, MongoDB

Tools: Git, GitHub, Vite, Vercel, Render
